Quiz 6- Streaming

Create a class called Earth. Assume you already have a list of country names (Strings) called countries. From the main() method, use the intermediate and terminal streaming operations to do the following:

- a) Collect in a new list: all countries that start with A or T, in uppercase, sorted by length.
- b) Print in reverse (do not store in a list) all countries that contain exactly 2 vowels.
- c) Create a method called `getStream()` which takes a List of Strings as an argument and returns a Stream of Strings that are not null, not blank, and are at least four characters long.
